

[0066] ABSTRACT: An improved scraper (20), utilizing a metal blade (75), to scrape debris from a variety of hard and soft surfaces. It features an integrated mechanism providing a flexible locking tab arm (21) and locking tab head (22) securing the unit to a sheath (40) designed to receive the scraper (20) and the locking tab head (22) within a locking tab head hole (41). The scraper (20) provides a removable blade storage cover (60) exposing a blade storage cavity (27) providing storage for spare blades. A flexible blade locking tab (21) to secure a metal blade (75) for use. A sheath (40) that mates with complimentary tools such as, and not limited to, for example, mops, dust-mops, brooms etc. via a pair of flexible mounting arms (44) that conform to the radius of such tools.
